## PROFESSIONAL SUMMARY

Backend-focused Software Engineer building scalable APIs, secure backend systems, and production-oriented applications using TypeScript and Node.js. Experienced across authentication, workflow automation, distributed processing, and backend architecture through product development, internships, and production-style projects.

## SKILLS

- **Languages:** TypeScript, JavaScript, SQL
- **Backend:** Node.js, Express.js, NestJS, REST APIs
- **Databases:** PostgreSQL, MongoDB, Redis, SQLite
- **Architecture:** Authentication, RBAC, Background Jobs, Distributed Systems, API Design.
- **Infrastructure:** Docker, CI/CD (GitHub Actions), Linux, Cloud Deployment
- **Tools:** Prisma, TypeORM, OpenAPI, Swagger, Git, Testing (Vitest, Supertest)
- **Frontend:** React, TypeScript

## WORK EXPERIENCE

**Backend Engineer Intern - HNG Tech** | *Apr 2026 – Present*

- Contributed to backend development of SEIL, a guided marketing funnel platform helping SMBs generate and execute personalized marketing workflows through conversational onboarding and guided execution flows.
- Built authentication infrastructure including email/password registration, Google OAuth login flows, redirect handlers, profile management, password update flows, and notification preferences.
- Designed funnel generation APIs and implemented stage progression workflows enabling controlled completion and unlock logic across sequential funnel execution phases.
- Developed notification feed APIs supporting real-time product interactions and user engagement workflows.
- Collaborated in a cross-functional team environment delivering MVP functionality under production-oriented development practices.

## FEATURED PROJECTS

**Insighta Labs+**

GitHub: <https://github.com/JohnUghiovhe/insighta-backend>

Designed and built a multi-interface backend platform powering both Web and CLI experiences from a centralized backend.

- Implemented GitHub OAuth with PKCE for browser and terminal authentication flows.
- Built deterministic natural-language profile search with structured parsing.
- Designed secure token lifecycle management using hashed access and refresh tokens.
- Enforced RBAC, request logging, route-scoped rate limiting, and unified authorization across interfaces.

## Background Job Scheduler

GitHub: <https://github.com/JohnUghiovhe/background-job-scheduler>

Production-ready distributed background processing system with workers and Redis as the single source of truth.

- Designed a dual scheduling engine using a heap-based priority queue and hierarchical timing wheel.
- Implemented DAG workflow execution, distributed locking, starvation prevention, retry orchestration, and dead-letter queue recovery.
- Built independent API and worker processes communicating through Redis.
- Added SSE-driven observability and a real-time dashboard for queue visibility and recovery operations.

## Retry Engine

GitHub: <https://github.com/JohnUghiovhe/retry-engine>

Resilient HTTP execution engine designed around controlled failure recovery.

- Built asynchronous retry workflows using exponential backoff and randomized jitter.
- Designed background processing with persisted execution history using SQLite.
- Implemented request validation, failure classification, retry policies, and worker orchestration.
- Improved reliability through structured state transitions and operational observability.

## EDUCATION

- **Backend Engineering** - TechCrush (Cohort 7) 2026 - present.
- **Diploma in Software Engineering** – AltSchool Africa 2025 – 2026
- **B.Sc. in Technical Education** – Ambrose Alli University 2017

## AWARDS

- **Best Learner** — Diploma in Backend Engineering | AltSchool Africa (2026)

## CERTIFICATIONS

- Project Management Institute (PMI) – Project Management Professional (2019)
